The human apolipoprotein(a) kringle domains IV36 protein), IV37 (LK7 protein) and V38 (LK8 protein) together form the angiogenesis inhibitor, LK68 protein. LK68 protein, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo choricallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic disease in animals or humans. LK68 is useful as an anticancer agent ar also for inhibiting primary tumour growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel angiogenesis inhibitor, LK68 for treating angiogenesis-mediated diseases, e.g. cancer and rheumatoid arthritis, has human apolipoprotein(a) kringle domains IV36, IV37 and V38 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; angiogenesis inhibitor; LK68; apolipoprotein(a) kringle domain; angiogenesis-mediated disease; cancer; rheumatoid arthritis; therapy; cytostatic; antirheumatic; antisrthritic; antipsoriatic; psoriasis;

LK68 protein contains the amino acid sequences of human apolipoprotein(a) kringle domains IV36 (LK6 protein). IV37 (LK7 protein) and V38 (LK8 protein). LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo chorioallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic disease in animals or humans.

LK68 is useful as an anticancer agent and also for inhibiting primary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    donor, or culturing cells capable of producing plasminogen activator in conditioned culture medium (CCM) and contacting the CCM with plasminogen. Angiostatin produced by method of the invention is useful for treating animals with angiogenesis diseases. It is useful for treating an angiogenic disease such as neoplastic diseases (e.g. tumours and tumour metastasis), benign tumours (e.g. hemangiomas, acoustic neuromas, etc), connective tissue disorders (e.g. rheumatoid arthritis and atherosclerosis), ocular angiogenic diseases (e.g. diabette retinopathy, corneal graft rejection, etc), cardiovascular diseases, cerebral vascular diseases, diabettes associated diseases and immune disorders (e.g. chronic inflammation and autoimmunity). The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having himproved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence represents a multifunctional protein of the

The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, overlan, prostate, pancreatic, gastric, colon, renal, bladder cancers, melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence represents a multifunctional protein of the

This invention describes a novel viral gene therapy vector comprising nucleic acid molecule encoding an anti-angiogenic polypeptide chosen

The patent discloses a DNA molecule encoding a fusion protein comprising a signal sequence, an immunoglobulin Fc region, and an angiogenesis inhibitor selected from angiostatin, endostatin, a plasminogen fragment having angiostatin activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The fusion protein (immunofusin) is

Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, such as rheumatoid arthritis, tumors and macular degeneration -

The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells ex vivo and then administered to the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; immunoglobulin gamma Fc fragment; angiostatin; immunofusin; angiogenesis; inhibitor; cytostatic; antirheumatoid; antiarthritic; antipsoriatic; antidiabetic; ophthalmological; immunosuppressant; vasotropic; vulnerary; treatment; antiarteriosclerosis; tumour; metastasis; atherosclerosis; psoriasis; rheumatoid arthritis; ocular angiogenic disease; diabetic retinopathy; macular degeneration; myocardial angiogenesis; plaque neovascularisation; telangiectasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

The DNA constructs may be used in gene therapy. The present sequence is a human angiostatin used in the construction of immunofusin containing human impured by the second of immunofusin containing human impured the second of immunofusin containing human immu
The specification describes multifunctional proteins which comprise combinations of angiostatin, endostatin, interferon, thrombospondin, interferon-inducible protein and platelet factor 4, and have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used to inhibit angiogenesis and to treat diseases or conditions mediated by angiogenesis. Conditions that may be treated include solid tumours, blood born tumours, tumour metastasis, benign tumours including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor
                                                                                                                                                                                                                                                   Preparation of Kringle five peptide fragment for treating various disorders such as angiogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                03-MAY-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       335
```

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC and carcinomas of various organs such as breast, genital tract, CC endocrine glands, skin, tumours of the brain and eyes and solid tumours CC arising from haematopoietic malignancies such as leukaemias and CC lymphomas. They are also used for the prophylaxis of various autoimmune CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC (e.g., biseases caused by excessive or abnormal stimulation of CC endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases (c.g. haemangiomas, Osler-Webber CC (e.g., calls (e.g., Crohn's disease, atherosclerosis), diseases (c.g., cat scratch CC disease and ulcers). The psptides are also useful as a birth control CC agent which inhibits ovulation and establishment of the placenta. CC sequences AAB01906-B01919 represent fragments of human plasminogen used CC in an exemplification of the invention.

CC Note: This sequence is not shown in the specification, but is derived CC from the full length human plasminogen sequence (AAB01887) shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC amino acids 101-354. Angiostatin and greenstatin are used as thrombolytic factors and angiogenesis inhibitory proteins. Angiostatin contains the kringle 1-4 region of plasminogen, and greenstatin contains the kringle 1-4 region of plasminogen, and greenstatin contains contains the kringle 1-4 region of plasminogen, and greenstatin contains contains the kringle 1-3 region of plasminogen. As both proteins contain a high contains of disulphide bonds, they are difficult to purify. The contain a high contains a protein of such greenstation describes a method for the purification of such and contains, produced as inclusion boddes in Escherichia coli and contains, produced as inclusion boddes in Escherichia coli and containing the solubilised fraction in buffer containing urea and containing. The angiogenesis inhibitory proteins specifically inhibit contains are used to suppress angiogenesis, specifically for treating concers (e.g. of lung, skin and brain) or ophthalmic diseases (e.g. glaucoma and diabetic retinopathy), but also arthritis and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a preferred angiogenesis inhibitor of the invention that is obtained by cleavage of human plasminogen with spitting cobra (Naja nigricollis nigricollis) venom K4 protease and plasmin. The K4 protease cleaves native plasminogen to following amino acid residue 452, with little or no disruption of the first 4 plasminogen kringles. Plasmin cleaves between residues 77 and 78 of human plasminogen. Thus, the present protein spans amino acid residues 78-451 of plasminogen. The angiogenesis inhibitors obtained from plasminogen can be used to inhibit tumour growth in a mammal, preferably human. They are useful for treating angiogenesis—associated diseases such as: solid tumours, prostate cancer, breast cancer, colon cancer and lung cancer (claimed); blood-borne tumors such as leukaemia; metastasis, benign tumours;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a preferred angiogenesis inhibitor of the invention that is obtained by cleavage of human plasminogen (CC with spitting cobra (Naja nigricollis nigricollis) venome (A) with spitting cobra (Naja nigricollis nigricollis) venome (A) corrected and plasmin. The K4 protease cleaves native plasminogen (CC protease and plasminogen kringles. Plasmin cleaves between residues (CC the first 4 plasminogen kringles. Plasmin cleaves between residues (CC the first 4 plasminogen kringles. Plasminogen. The angiogenesis spans (CC the first 4 plasminogen. Thus, the present protein spans (CC thibitors obtained from plasminogen can be used to inhibit tumour (CC tribibitors obtained from plasminogen can be useful for treating candidations obtained from plasminogen can be useful for treating (CC tribibitors such as leukasmia; metastasis; benign tumours; prostate (CC clamer, breast cancer, colon cancer and lung cancer (claimed); (CC tribibitors such as leukasmia; metastasis; benign tumours; prostate (CC tribibitors) pooriasis; ocular angiogenic diseases; (CC the manatoid arthritis; psoriasis; ocular angiogenic diseases; (CC the mour of endothelial cells; and as birth control (CC agents by preventing vascularization required for embryo (complantation. The inhibitors are administered also to extend the common of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases and to stabilize any residual primary (complantation) of micrometastases (collantation) of high primary (collantation) of micrometastases (collantation) of high primary (collantati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

the DNA sequences encoding them. Angiogenesis is the generation of new blood vessels into a tissue, and normally occurs in wound healing, foetal and embryonal development and the formation of the corpus luteum, endometrium and placenta. Angiostatin is a protein (see AAB16450 and AAA68202) involved in angiogenesis, and has an amino acid sequence similar to that of a plasminogen fragment (see murine plasminogen AAB16490). Angiostatin has the ability to inhibit angiogenesis. And AAB16490) and plasminogen fragment (see murine plasminogen AAA68203). Sequences AAA68242 and AAB16522 represent coding and protein sequences of human laminin. Laminin is an angiostatin binding protein, and some of the peptides of the invention share homology with regions of laminin. Peptides AB16452-B16521 (excluding AAB16490) are the
                                                           angiogenesis-inhibiting protein receptor fragments of the invention. The peptides bind either angiostatin or endostatin and can be used in methods for treating diseases and processes that are mediated by angiogenesis, such as solid tumours, psoriasis, seleroderma, myocardial angiogenesis, Crohn's disease, cerebral collaterals, arteriovenous malformations, rubeosis, diabetic retinopathy, arthritis, wound healing, peptic ulcers, Helicobacter related diseases, fractures, placentation and cat scratch fever. They are useful for the detection and prognosis of cancer. DNA sequences A628204-A628241 encode the peptides of the invention.

                                                                                                                                                                                                                                                                       The present invention relates to methods of regulating angiogenesis in an individual by administering an angiogenesis regulating composition comprising a tropomyosin binding compound or an actin disrupting compound. The compositions are useful for treating diseases and processes mediated by angiogenesis including haemangioma, solid tumours, blood bourne tumours, leukaemia, metastasis, Crohn's disease, coronary or cerebral collaterals, arthritis, diabetic neovascularisation, macular degeneration, wound healing, Helicobacter related diseases, ovulation, menstruation, and cat scratch fever. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Regulating angiogenesis and treatment of angiogenesis-mediated diseases, e.g. hemangioma, tumors or cancer, by administering a tropomyosin binding compound or actin disrupting compound -

Sequence 8, Application US/09946893 Patent No. US20020072494A1

GENERAL INFORMATION:
APPLICANT: Cao, Yihad
TITLE OF INVENTION: Materials and methods relating to endothelial cell growth
TITLE OF INVENTION: inhibitors
FILE REFERENCE: Mewburn
CURRENT APPLICATION UMBER: US/09/946,893
CURRENT APPLICATION NUMBER: US 60/230,893
